# Distribution of Virginia Adjusted Gross Income by Income Class, 1980

**John L. Knapp**

## INTRODUCTION

Administrative records from the Virginia Department of Taxation provide a useful source of information on local income distribution. This report is the ninth in a series based on the Department's records. The first report covered the distribution of adjusted gross income (AGI) in 1972, and the second covered the distribution in 1973 with additional information on total AGI and number of tax returns beginning with 1963. The next six reports covered the distribution of AGI in each year, 1974 through 1979, and this report shows comparable data for 1980.

AGI, other than certain deductions (primarily business expenses), is equal to gross income except for Social Security benefits and other transfer payments, employer contributions to private pension and health plans, non-cash imputed income, and income in-kind. The AGI data cover all individuals and married couples required to file a return for 1980: 1) anyone who had Virginia income tax withheld or who paid an estimated income tax for 1980; 2) any individual with AGI more than $3,000; 3) a married couple with both persons under age 65 with a combined AGI more than $3,000; 4) a married couple with one spouse 65 or over with a combined AGI more than $3,500; and 5) a married couple with both persons 65 or over with a combined AGI more than $4,500.

In 1980, AGI totaled $37.3 billion and amounted to 74% of Virginia personal income.1/ Personal income is a broad measure of income that includes transfer payments and certain types of non-cash income which are not taxable. The proportion of the population covered by the AGI data can be roughly estimated by comparing the reported number of personal and dependent exemptions with a separate count of the total population. In 1980, the number of exemptions was 4,720,807 or 88% of the 1980 Census population of 5,346,818.

A brief review of economic conditions in 1980 may help to place the figures in this report in perspective. In 1980, there was a recession. Real gross state product, a measure of total output, decreased by 1.3%--in contrast to the 1958-80 trend rate of 4.6% annually. Nonagricultural wage and salary employment increased by only 1.5% compared to 4.0% in the previous year. The state's unemployment rate, which averaged 5.1%, was up slightly from 1979. Inflation, as measured by the U.S. consumer price index (CPI), averaged 13.5%, the highest annual rate since 1947.

1/ Survey of Current Business, Vol. 60, No. 8, (August 1980), p. 66.

ANALYSIS

## Introduction

The appendix tables contain data on all returns and the two subcomponents--married couple returns and individual returns. In addition, there is information on AGI per exemption and an index of income concentration. These measures are discussed in the following pages.

## All Returns

Statewide, the median AGI per return was $13,345, up 9.5% from the preceding year. However, after adjustment for inflation, the median declined by 3.6%. The overall county median was $14,154 compared to $12,364 for cities (see Table A1). A major reason for this difference was that married couple returns, which tend to have higher incomes than individual returns, represented a larger proportion of the returns for the counties than for the cities. The highest income area, Fairfax County ($19,807), had a median AGI 2.4 times greater than the lowest area, Northampton County ($8,116). Other high income localities were Chesterfield County ($19,125), Prince William County ($18,879), Loudoun County ($17,751), and the City of Manassas ($17,368). All of the top five localities were located either in Northern Virginia or the Richmond area. Other low income localities were Brunswick County ($8,794), Buckingham County ($8,974), Accomack County ($9,060), and Lunenburg County ($9,159). Thus, the lowest income localities were in the Eastern Shore, Central Virginia, and Southside Virginia.

Together, the ten standard metropolitan statistical areas (SMSAs) had a median AGI of $14,247 compared to $11,550 for the non-SMSA portions of the state (see page for a listing of localities contained in SMSAs and planning districts). Among the SMSAs, the Northern Virginia portion of the Washington, D.C.-Md.-Va. SMSA had the highest median ($18,310). The lowest median was in the Danville SMSA ($11,264).

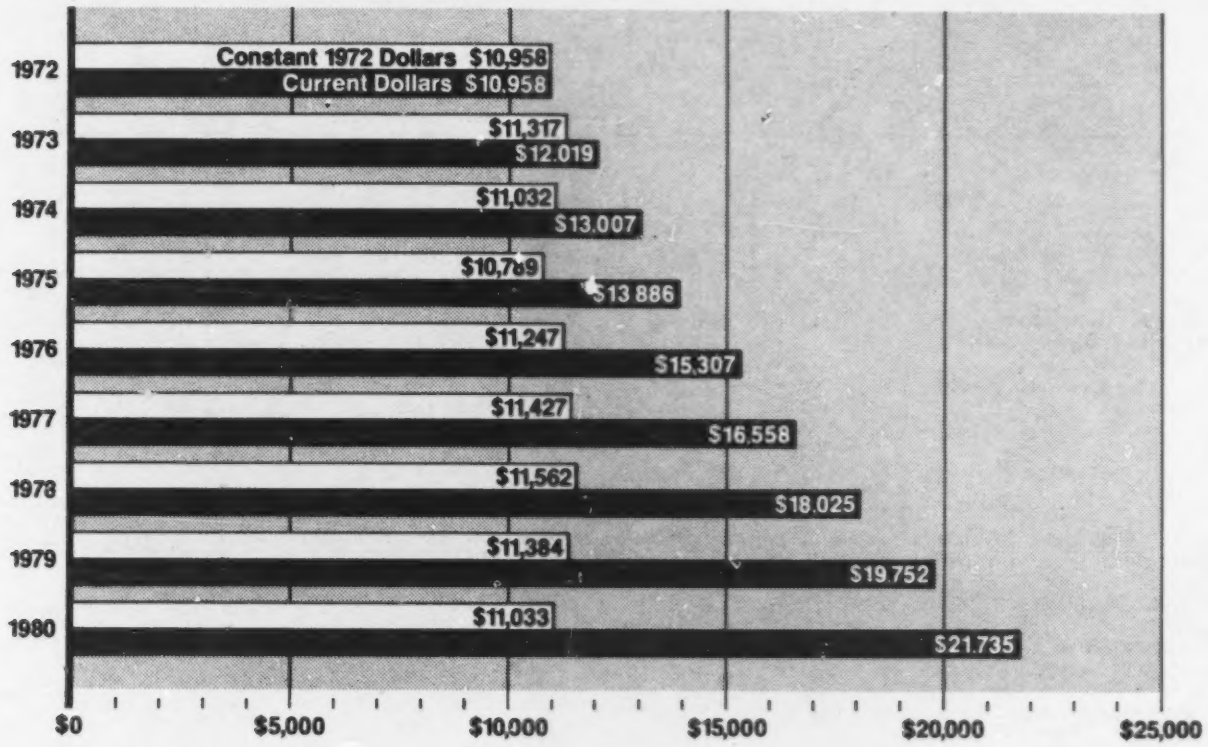
Among the twenty-two planning districts, the medians ranged from $18,310 in the Northern Virginia Planning District to $8,780 in the Accomack-Northampton Planning District.

In addition to providing median AGI, Table A1 contains information on the distribution of AGI. Statewide, 11.6% of the returns had AGI of less than $3,000; 8.3% had $3,000 to $4,999; 19.9% had $5,000 to $9,999; 15.1% had $10,000 to $14,999; 11.9% had $15,000 to $19,999; 9.5% had $20,000 to $24,999; 7.2% had $25,000 to $29,999; 5.2% had $30,000 to $34,999; 3.5% had $35,000 to $39,999; and 7.7% had $40,000 or more.

As might be expected, the locality with the highest median income had a very large percentage of returns in the highest AGI class. In Fairfax County, 21.6% of the returns showed incomes of $40,000 or more.

The median AGI on all returns is not a good proxy for median household money income. In 1975, a year in which Virginia median household income was estimated by the U.S. Bureau of the Census, median household income was 35% greater than

**Figure 1.**
**Virginia Median AGI Per Married Couple**



median AGI on all returns.2/ Although there were many reasons for the difference, the principal one was that members of the same household often filed separately.

Married Couple Returns

In 1980, returns filed by married couples accounted for 52% of all returns and 74% of the adjusted gross income. Married couple returns are composed of all returns filed by husband-wife families, including those with dependents.

Statewide, median AGI per married couple return was $21,735, a figure 10.0% higher than income in 1979. However, after adjustment for changes in purchasing power, median income dropped by 3.1%. Since the beginning of this series in 1972, there has been a large rise in AGI as measured in current dollars (see Figure 1). Nonetheless, in terms of constant dollars adjusted for changes in the CPI, there has been only a modest gain; over the eight year period real median AGI rose by only 0.7%.

n.a.= not available.

a/ The relative price index used to adjust actual dollars to constant dollars excluded the Danville SMSA and the Virginia portion of the Johnson City-Kingsport-Bristol SMSA.

b/ Virginia portion only.

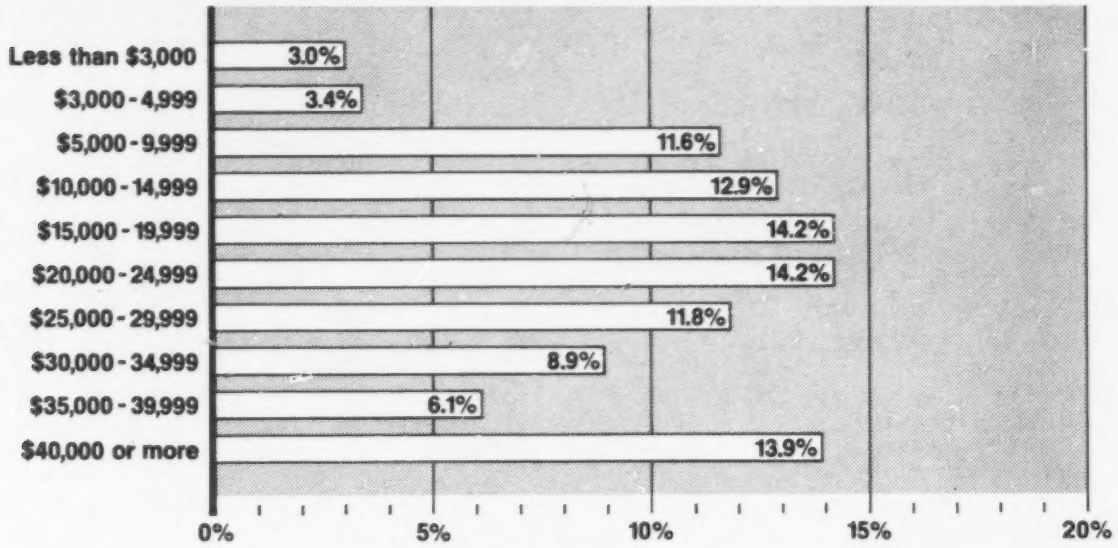
The 1980 median AGI for all counties was $22,233, and that for the cities was $21,210 (see Table A2). All of the five highest localities were in Northern Virginia. Fairfax County ($35,630) and Fairfax City ($31,995) led, followed by Arlington County ($31,045), Alexandria City ($28,992), and Prince William County ($28,624). The five lowest localities were the counties of Grayson ($13,429), Charlotte ($13,457), Northampton ($13,551), Lunenburg ($13,581), and Brunswick ($13,675).

The median AGI in the portion of the state included in SMSAs was $24,211 compared to $17,639 for the non-SMSA portion. Based on the 1980 Census, seven out of every ten Virginians live in an SMSA. Among the SMSAs, the Northern Virginia portion of the Washington, D.C.-Md.-Va. SMSA had the highest median ($32,517) followed distantly by Richmond ($24,473). The lowest median was in the Virginia portion of the Johnson City-Kingsport-Bristol SMSA ($15,674).

To a certain extent, the variation among SMSAs in median AGI reflects differences in living costs. When the data are adjusted using a relative price index, the Northern Virginia portion of the Washington, D.C.-Md.-Va. SMSA remains the highest income metropolitan area (see Table 1). However, the adjustment narrows the differences among areas. In actual dollars, the ratio of highest (Northern Virginia) to lowest[3/] (Lynchburg) was 1.65 to 1. After

3/ This comparison excludes the Danville and Johnson City-Kingsport-Bristol SMSAs because of the unavailability of price indexes for them.

**Figure 2.**
**Distribution of Virginia Married Couple Returns by AGI Class, 1980**



adjustment for price differences, the ratio of highest (Northern Virginia) to lowest (Charlottesville) was 1.36 to 1.

Among the planning districts, the median ranged from $32,517 in the Northern Virginia Planning District to $14,317 in the Accomack-Northampton Planning District.

Statewide, 3.0% of the returns filed by married couples had AGI of less than $3,000; 3.4% had $3,000 to $4,999; 11.6% had $5,000 to $9,999; 12.9% had $10,000 to $14,999; 14.2% had $15,000 to $19,999; 14.2% had $20,000 to $24,999; 11.8% had $25,000 to $29,999; 8.9% had $30,000 to $34,999; 6.1% had $35,000 to $39,999; and 13.9% had $40,000 or more (see Figure 2). The greatest concentration of high incomes occurred in Fairfax County where the $40,000 or more class contained 40.4% of the returns.

Median AGI reported on married couple returns is a fairly good proxy for median family Census money income even though AGI differs from Census money income and married couples are a subset of all families.4/ Median AGI in 1980 was close to national median family income of $21,022.5/ In 1975, for the state as a whole, median AGI per married couple return was 95% of median family

---

4/ The Census definition of family includes families with only one spouse present, whereas Virginia AGI married returns are limited to husband-wife families that file returns.

5/ U.S. Bureau of the Census, "Money Income and Poverty Status of Families and Persons in the United States: 1980 (Advance Report), " Current Population Reports, Consumer Income, Series P-60, No. 127 (August 1981), p. 7.

income.6/ For individual counties and cities, the percentage would vary depending on local conditions such as the population living in poverty, the number of military personnel, and the number of persons receiving transfer payments (e.g., Social Security benefits and welfare).

## Individual Returns

Tax returns of single, divorced, separated, or widowed taxpayers are classified as individual returns. In 1980, statewide median AGI for individual returns was $7,673, an increase of 10.8% over 1979. After adjustment for inflation, median AGI decreased by 2.4%. The median for counties was $7,623, and that for cities was $7,751 (see Table A3). The five highest localities were Arlington County ($13,073), Alexandria City ($12,668), Falls Church City ($10,039), Fairfax County ($9,339), and Henrico County ($8,615). The five lowest localities were Northampton County ($5,059), Poquoson City ($5,451), Montgomery County ($5,550), Dickenson County ($5,652), and Lee County ($5,810).

The median for all SMSAs was $8,138 and for non-SMSAs it was $6,590. The Virginia portion of the Washington, D.C.-Md.-Va. SMSA had the highest median ($10,348), and the Virginia portion of the Johnson City-Kingsport-Bristol SMSA had the lowest figure ($6,571).

Among the planning districts, the medians ranged from $10,348 in the Northern Virginia Planning District to $5,805 in the Accomack-Northampton Planning District.

## AGI Per Exemption

Table A4 shows AGI per exemption. To reduce double counting, the extra exemptions for age and blindness have been excluded. However, double counting remains because some children with taxable income are legally counted twice--on their parents' returns and on their own. AGI per exemption is similar to a per capita measure except the divisor contains only the population with adjusted gross income rather than the total population.

For the state as a whole, 1980 AGI per exemption was $7,910, up 10.8% over 1979. For counties, the figure was $8,001 and for cities, $7,755 (see Table A4). Among localities, the five highest were Arlington County ($12,954), Alexandria City ($11,751), Fairfax County ($11,105), Falls Church City ($10,662), and Fairfax City ($10,203). The five lowest localities were the counties of Buckingham ($4,767), Brunswick ($4,825), Charlotte ($4,864), Grayson ($4,912), and Lunenburg ($4,923).

Variation in AGI per exemption among localities may be measured in several ways. The simplest approach is to compute the ratio of the highest to the lowest observation. In 1980, the ratio was $12,954 to $4,767 or 2.72 to 1. A more sophisticated measure is the coefficient of variation which shows the standard deviation as a percentage of the mean. The higher the value, the more the variation. In 1980, the coefficient of variation was 20.0%, virtually unchanged from the results for earlier years.

---

6/ U.S. Bureau of the Census, "Money Income and Poverty Status in 1975 of Families and Persons in the United States and the South Region, by Divisions and States," (Spring 1976 Survey of Income and Education), Current Population Reports, Consumer Income, Series P-60, No. 112 (June 1978), p. 97.

AGI per exemption was $8,588 in the SMSA portion of the state compared to $6,300 in the non-SMSA portion. Among the SMSAs, the Virginia portion of the Washington, D.C.-Md.-Va. SMSA with $10,864 outstripped the other SMSAs by a wide margin. The Virginia portion of the Johnson City-Kingsport-Bristol SMSA had the lowest AGI per exemption ($6,141).

Among the planning districts, AGI per exemption was highest in the Northern Virginia Planning District ($10,864) followed distantly by the Richmond Planning District ($8,452). The Piedmont Planning District ($5,242) had the lowest figure.

## Index of Income Concentration

An index of income concentration for all returns is shown in Table A5. The index is based on the concept of a Lorenz curve which is a plot of the cumulative percentage of returns and the cumulative percentage of AGI accounted for by those returns. The index of income concentration is a measure of the difference in area between a hypothetical Lorenz curve based on the same AGI for each return and the actual Lorenze curve.7/ The greater the difference, the higher the index and the more unequal the distribution.

In 1980, the state average was .333. Among localities, the index ranged in value from .381 in Williamsburg City to .261 in Carroll County. Generally, the large central cities had greater inequality than their associated suburbs. For example, Richmond City had an index of .354 compared to .292 in Chesterfield County, .316 in Hanover County, and .318 in Henrico County.

The SMSA and non-SMSA portions of the state had similar indexes, .335 and .321, respectively. Among the ten SMSAs, the indexes showed little variation, except for the Charlottesville SMSA which was higher than the other metropolitan areas.

Among the twenty-two planning districts, the greatest inequality of income was in the Rappahannock-Rapidan Planning District (.351) followed by the Thomas Jefferson Planning District (.348) and the Northern Neck Planning District (.347). The least amount of inequality occurred in the Mount Rogers Planning District (.301) and in the Southside Planning District (.304).

## COMPARISONS OF INCOME CONCEPTS

### Census Money Income

Adjusted gross income is not the same as money income reported by the Bureau of the Census. Unlike Census money income, AGI excludes transfer payments such as Social Security benefits, welfare payments, and unemployment compensation.

---

7/ Index of income concentration = $1/2 \sum_{i=1}^{k} \left| X_i - Y_i \right|$ where $X_i$ and $Y_i$ are uncumulated percentages of the distribution of total returns by AGI class (X) and the distribution of total AGI by AGI class (Y). For a description of the method of computation see U.S. Bureau of the Census, The Methods and Materials of Demography by Henry S. Shryock, Jacob S. Siegel and associates (Washington, D.C.: Government Printing Office, 1971,), pp. 178-80.

In addition, AGI does not cover income of persons with incomes below the filing requirement. Persons receiving transfer payments and those with income below the filing requirement are included in the tax statistics only if they had some additional taxable income or had to file in order to receive a refund of tax withheld.

AGI also excludes income of armed forces personnel who retain legal residence in another state. The omission of this military income results in the reporting of relatively low amounts of total AGI in militarily impacted areas such as Prince George County, Norfolk City, and Virginia Beach City. Furthermore, since non-military income and income of the spouse are taxable, the tax statistics may exaggerate the number of low AGI returns in militarily impacted areas. On July 1, 1977, military payroll offices began withholding state income taxes; this procedure reduced underreporting of income by military personnel who were Virginia residents.

AGI does include certain capital gains, an income category not included in the definition of Census money income. At the state level, AGI also contains some nonresident income, whereas Census income is restricted to resident income.

A final difference between the two concepts is the reporting unit. The principal Census reporting units are families, unrelated individuals, and households. The major tax reporting units are individual returns and married couple returns. Married couple returns are further subdivided into joint, combined, and separate returns. None of the tax units is entirely comparable with any Census unit.

Despite their differences in concept and coverage, AGI and Census money income correspond roughly in magnitude. In 1977, the most recent year reported in Bureau of the Census estimates for federal revenue sharing, total AGI was 89% of Census total money income for Virginia.[8/] A regression of 1975 local area estimates of Census money income per capita on 1975 AGI per exemption yielded an adjusted coefficient of determination ($R^2$) of .8422.[9/]

Personal Income

AGI differs also from the concept of personal income developed by the U.S. Department of Commerce, Bureau of Economic Analysis (BEA), and used by the Tayloe Murphy Institute in its county and city personal income estimates. Personal income is a broader concept than either Census money income or AGI. Unlike AGI, personal income includes (1) all transfer payments such as Social Security and unemployment benefits; (2) certain fringe benefits; (3) imputed income such as wages and salaries paid in-kind, the net rental value of owner-

occupied houses, the net value of food and fuel produced and consumed on farms, and imputed interest earned from financial intermediaries; (4) dividends excluded from taxation; and (5) tax-exempt interest and dividend distributions. On the other hand, AGI includes certain items excluded from personal income: (1) personal contributions for social insurance (principally employee Social Security taxes and federal employee retirement payments); and (2) the net taxable gain from the sale of capital assets. Furthermore, there are differences in coverage. Personal income includes the income of certain categories not contained in AGI, the most important of which are low income persons not required to file a state tax return, non-resident members of the armed forces, and private trust, pension, health, and welfare funds. As previously mentioned, in 1980, state AGI reported on Virginia tax returns was 74% of total personal income estimated by the BEA. A regression of 1977 BEA local area estimates of per capita income on 1977 AGI per exemption yielded an adjusted coefficient of determiniation of .7044.10/

## LIMITATIONS OF THE DATA

The major limitations are the inaccuracy of some of the geographic coding, the treatment of data for married couples filing separate returns, and the method of deriving medians.

Geographic coding of the tax returns may be a problem in a few localities. Although taxpayers are required to show their city or county of residence, some taxpayers fail either to provide correct information or to answer the question. Confusion of post office address with place of residence is the usual source of incorrect information. In addition, use of ZIP codes or post office information by tax officials in allocating returns listing no place of residence may result in similar errors.

Married couples can file in one of three ways--by using a joint return, a combined return, or separate returns. For 1980, the great majority (96%) selected either the joint return or the combined return. The Department of Taxation statistics do not match the separate returns for each married couple. In the absence of matching, it was assumed for the purpose of calculating medians for married returns that within each AGI class two separate returns were equivalent to one joint or combined return. Although unavoidable, this was an extreme assumption since the more likely case is that a husband's AGI would fall in a different class than his wife's AGI.

Since all medians were derived from grouped data, it was necessary to make an assumption concerning the distribution of income within the class interval containing the median. In the absence of additional information, a uniform distribution was assumed. This procedure was probably adequate in most cases, but derivation of the medians from ungrouped data would have been preferable.

---

10/ The equation was $Y_c = -1{,}171 + 1.3709X$.

Note: Whenever there were less than four returns in an AGI class the returns were grouped with those in the next lower class in order to avoid disclosure.

a/ Details may not add to 100.0 due to rounding.

b/ Returns unassigned to geographic area because the proper city or county could not be ascertained or because the returns were filed by nonresidents.
